1. Always make sure every element is using the grid system. Flexbox is okay for aligning elements, but I believe Marco said it is important to have the grid with your projects.
   -There is a file Marco gave us called grid.css which makes the process easier
2. Styling is preferable to be coded into the css style sheets, rather than hardcoding it into the html. For example, heights should go into the css.
3. Always double check the folders and files when pulling down a github repo in case there's something useful in there
4. All files should have no spaces in the file names; underlines or dashes are the preference for file naming
5. Alt tags, however, are allowed to have spaces. They are for screen readers as something to read as an alternative to images
6. You can use <hr> instead of hard coding a line; hr just creates a line that you can style
